Package 'MetaGxBreast'

April 1, 2025

Type Package

Title Transcriptomic Breast Cancer Datasets

Version 1.26.0

Date 2020-04-23

Description A collection of Breast Cancer Transcriptomic Datasets that are part of the MetaGxData package compendium.

License Apache License (>= 2)

Depends R (>= 3.6.0), Biobase, AnnotationHub, ExperimentHub

Imports stats, lattice, impute, SummarizedExperiment

Suggests testthat, xtable, tinytex

NeedsCompilation no

biocViews ExpressionData, ExperimentHub, CancerData, Homo_sapiens_Data, ArrayExpress, GEO, NCI, MicroarrayData, ExperimentData

LazyData yes

RoxygenNote 7.1.1

`CAL` *CAL*

Description

ExpressionSet for the CAL Dataset

Format

```
experimentData(eset):
Experiment data
  Experimenter name:
  Laboratory:
  Contact information: http://www.ncbi.nlm.nih.gov/pubmed/17157792
  Title:
  URL: http://www.ebi.ac.uk/arrayexpress/experiments/E-TABM-158/
  PMIDs: 17157792
  No abstract available.
  notes:
   summary:
      Recurrent copy number abnormalities differ between tumor subtypes as defin
ed by gene expression patterns.  Accuracy of stratification by outcome can
 be improved by combining expression and copy number.
   mapping.method:
      maxRowVariance
   mapping.group:
      EntrezGene.ID
   preprocessing:
      As published by original author.

`dupplicates` *a list containing the names of patients that are believed to be dulicates across datasets*

Description

The object is a list where each element is a patient ID that is believed to be a duplicate of a patient in another dataset. Patients are designated as duplicated if they have Spearman correlations greater than or equal to 0.98 with other patient expression profiles

Format

A list with 107 elements, each of which is a patient ID.

`loadBreastDatasets` *Function to load breast cancer SummarizedExperiment objects from the Experiment Hub*

Description

This function returns breast cancer datasets from the hub and a vector of patients from the datasets that are duplicates based on a spearman correlation > 0.98

Usage

```
loadBreastDatasets(
  rescale = FALSE,
  minNumberGenes = 0,
  minNumberEvents = 0,
  minSampleSize = 0,
  keepCommonOnly = FALSE,
  imputeMissing = FALSE,
  removeDuplicates = FALSE
)
```

Arguments

`rescale`	apply centering and scaling to the expression sets (default FALSE)
`minNumberGenes`	an integer specifying to remove expression sets with less genes than this number (default 0)
`minNumberEvents`	an integer specifying how man survival events must be in the dataset to keep the dataset (default 0)
`minSampleSize`	an integer specifying the minimum number of patients required in a summarizedExperiment (default 0)
`keepCommonOnly`	remove entrezIDs not common to all datasets (default FALSE)
`imputeMissing`	remove patients from datasets with missing expression values
`removeDuplicates`	remove patients with a Spearman correlation greater than or equal to 0.98 with other patient expression profiles (default TRUE)

Value

A 'list' with 2 elements. The First element named 'SummarizedExperiment's contains the datasets. The second element named duplicates contains a vector with patient IDs for the duplicate patients (those with Spearman correlation greater than or equal to 0.98 with other patient expression profiles).

`loadBreastEsets` *Function to load breast cancer expression sets from the Experiment Hub*

Description

This function returns breast cancer datasets from the hub and a vector of patients from the datasets that are most likely duplicates

Usage

```
loadBreastEsets(
  loadString = "majority",
  removeDuplicates = TRUE,
  quantileCutoff = 0,
  rescale = FALSE,
  minNumberGenes = 0,
  minNumberEvents = 0,
  minSampleSize = 0,
  removeRetracted = TRUE,
  removeSubsets = TRUE,
  keepCommonOnly = FALSE,
  imputeMissing = FALSE
)
```

Arguments

`loadString`	a character vector specifying which data will be loaded. The default is "majority", which loads in 37 of the 39 datasets. The other option is to provide a character vecotr of the names of the datasets to load. The metabric and tcga datasets areloaded separately as they are very large and doing so will help prevent memory allocation errors for R windows. Furthermore, these datasets are so large that they dominate statistical analyses so it is best that they are analyzed separate of the 37 smaller datasets loaded with the string majority
`removeDuplicates`	remove patients with a Spearman correlation greater than or equal to 0.98 with other patient expression profiles (default TRUE)
`quantileCutoff`	A nueric between 0 and 1 specifying to remove genes with standard deviation below the required quantile (default 0)
`rescale`	apply centering and scaling to the expression sets (default FALSE)
`minNumberGenes`	an integer specifying to remove expression sets with less genes than this number (default 0)

`minNumberEvents`	an integer specifying how man survival events must be in the dataset to keep the dataset (default 0)
`minSampleSize`	an integer specifying the minimum number of patients required in an eset (default 0)
`removeRetracted`	remove datasets from retracted papers (default TRUE, currently just PMID17290060 dataset)
`removeSubsets`	remove datasets that are a subset of other datasets (defeault TRUE, currently just PMID19318476)
`keepCommonOnly`	remove probes not common to all datasets (default FALSE)
`imputeMissing`	remove patients from datasets with missing expression values

Value

a list with 2 elements. The First element named esets contains the datasets. The second element named duplicates contains a vector with patient IDs for the duplicate patients (those with Spearman correlation greater than or equal to 0.98 with other patient expression profiles).

Examples

```
## Use the default loadString="majority" if you want the 37 smaller datasets
esetsAndDups <- loadBreastEsets(loadString = c("CAL", "DFHCC", "DFHCC2",
    "DFHCC3", "DUKE", "DUKE2", "EMC2"))
```

  notes:
   summary:
      A method was developed to separate tumor cells and their microenvironment
to test the prognostic abilities of the immune system. Results showed that
 lymphatic infiltration is beneficial for ER negative patients, but probab
ly not beneficial for ER positive patients.
