

# Package ‘musicatk’

October 17, 2024

**Type** Package

**Title** Mutational Signature Comprehensive Analysis Toolkit

**Version** 1.14.1

**Description** Mutational signatures are carcinogenic exposures or aberrant cellular processes that can cause alterations to the genome. We created musicatk (MUtational SIgnature Comprehensive Analysis ToolKit) to address shortcomings in versatility and ease of use in other pre-existing computational tools. Although many different types of mutational data have been generated, current software packages do not have a flexible framework to allow users to mix and match different types of mutations in the mutational signature inference process. Musicatk enables users to count and combine multiple mutation types, including SBS, DBS, and indels. Musicatk calculates replication strand, transcription strand and combinations of these features along with discovery from unique and proprietary genomic feature associated with any mutation type. Musicatk also implements several methods for discovery of new signatures as well as methods to infer exposure given an existing set of signatures. Musicatk provides functions for visualization and downstream exploratory analysis including the ability to compare signatures between cohorts and find matching signatures in COSMIC V2 or COSMIC V3.

**License** LGPL-3

**BugReports** <https://github.com/campbio/musicatk/issues>

**Encoding** UTF-8

**LazyData** TRUE

**biocViews** Software, BiologicalQuestion, SomaticMutation,  
VariantAnnotation

**Depends** R (>= 4.0.0), NMF

**Imports** SummarizedExperiment, VariantAnnotation, Biostrings, base,  
methods, magrittr, tibble, tidyverse, gtools, gridExtra,  
MCMLprecision, MASS, matrixTests, data.table, dplyr, rlang,  
BSgenome, GenomeInfoDb, GenomicFeatures, GenomicRanges,  
IRanges, S4Vectors, uwot, ggplot2, stringr,  
TxDb.Hsapiens.UCSC.hg19.knownGene,  
TxDb.Hsapiens.UCSC.hg38.knownGene, BSgenome.Hsapiens.UCSC.hg19,  
BSgenome.Hsapiens.UCSC.hg38, BSgenome.Mmusculus.UCSC.mm9,  
BSgenome.Mmusculus.UCSC.mm10, decompTumor2Sig, topicmodels,

ggrepel, plotly, utils, factoextra, cluster, ComplexHeatmap,  
 philentropy, maftools, shiny, stringi, tidyverse, ggpubr,  
 Matrix (>= 1.6.1)

**Suggests** TCGAbiolinks, shinyBS, shinyalert, shinybusy, shinydashboard,  
 shinyjs, shinyjqui, sortable, testthat, BiocStyle, knitr,  
 rmarkdown, survival, XVector, qpdf, covr, shinyWidgets,  
 cowplot, withr

**RoxygenNote** 7.3.1

**VignetteBuilder** knitr

**git\_url** <https://git.bioconductor.org/packages/musicatk>

**git\_branch** RELEASE\_3\_19

**git\_last\_commit** 95bec29

**git\_last\_commit\_date** 2024-07-13

**Repository** Bioconductor 3.19

**Date/Publication** 2024-10-16

**Author** Aaron Chevalier [aut] (0000-0002-3968-9250),

Joshua D. Campbell [aut, cre] (<<https://orcid.org/0000-0003-0780-8662>>)

**Maintainer** Joshua D. Campbell <camp@bu.edu>

<b>.jsd</b>	<i>Calculates 1 - Jensen-Shannon Divergences between all pairs of columns between two matrices</i>
-------------	--

## Description

Calculates 1 - Jensen-Shannon Divergences between all pairs of columns between two matrices

## Usage

```
.jsd(p, q, epsilon = 1e-07)
```

## Arguments

p	First matrix
q	Second matrix
epsilon	Number to add to all probabilities. Default 0.0000001.

## Value

Returns matrix of 1 - Jensen-Shannon Divergences

---

add\_flank\_to\_variants *Uses a genome object to find context and add it to the variant table*

---

## Description

Uses a genome object to find context and add it to the variant table

## Usage

```
add_flank_to_variants(  
  musica,  
  g,  
  flank_start,  
  flank_end,  
  build_table = TRUE,  
  overwrite = FALSE  
)
```

## Arguments

musica	Input samples
g	A <a href="#">BSgenome</a> object indicating which genome reference the variants and their coordinates were derived from.
flank_start	Start of flank area to add, can be positive or negative
flank_end	End of flank area to add, can be positive or negative
build_table	Automatically build a table using the annotation and add
overwrite	Overwrite existing count table

## Value

None it to the musica

## Examples

```
data(musica_sbs96_tiny)  
g <- select_genome("19")  
add_flank_to_variants(musica_sbs96_tiny, g, 1, 2)  
add_flank_to_variants(musica_sbs96_tiny, g, -2, -1)
```

add_variant_type	<i>Generates a variant type table</i>
------------------	---------------------------------------

## Description

Generates a variant type table

## Usage

```
add_variant_type(tab)
```

## Arguments

tab	Input variant table
-----	---------------------

## Value

Returns the inputted variant table with variant type ("SBS", "DBS", "INS", "DEL") added as an appended "Variant\_Type" column

## Examples

```
data(musica)
variants <- variants(musica)
musicatk::add_variant_type(variants)
```

annotate_replication_strand	<i>Add replication strand annotation to SBS variants based on bedgraph file</i>
-----------------------------	---

## Description

Add replication strand annotation to SBS variants based on bedgraph file

## Usage

```
annotate_replication_strand(musica, rep_range, build_table = TRUE)
```

## Arguments

musica	A <a href="#">musica</a> object.
rep_range	A GRanges object with replication timing as metadata
build_table	Automatically build a table from this annotation

**Value**

None

**Examples**

```
data(musica)
data(rep_range)
annotate_replication_strand(musica, rep_range)
```

---

**annotate\_transcript\_strand**

*Add transcript strand annotation to SBS variants (defined in genes only)*

---

**Description**

Add transcript strand annotation to SBS variants (defined in genes only)

**Usage**

```
annotate_transcript_strand(musica, genome_build, build_table = TRUE)
```

**Arguments**

musica	A <code>musica</code> object.
genome_build	Which genome build to use: hg19, hg38, or a custom TxDb object
build_table	Automatically build a table from this annotation

**Value**

None

**Examples**

```
data(musica)
annotate_transcript_strand(musica, 19)
```

**annotate\_variant\_length**

*Adds an annotation to the input musica's variant table with length of each variant*

**Description**

Adds an annotation to the input musica's variant table with length of each variant

**Usage**

```
annotate_variant_length(musica)
```

**Arguments**

<code>musica</code>	Input samples
---------------------	---------------

**Value**

None

**Examples**

```
data(musica)
annotate_variant_length(musica)
musica
```

**annotate\_variant\_type** *Annotate variants with variant type ("SBS", "INS", "DEL", "DBS")***Description**

Annotate variants with variant type ("SBS", "INS", "DEL", "DBS")

**Usage**

```
annotate_variant_type(musica)
```

**Arguments**

<code>musica</code>	A <code>musica</code> object.
---------------------	-------------------------------

**Value**

None

## Examples

```
data(musica)
annotate_variant_type(musica)
```

auto_predict_grid	<i>Automatic filtering of signatures for exposure prediction gridded across specific annotation</i>
-------------------	---

## Description

Automatic filtering of signatures for exposure prediction gridded across specific annotation

## Usage

```
auto_predict_grid(
  musica,
  table_name,
  signature_res,
  algorithm,
  sample_annotation = NULL,
  min_exists = 0.05,
  proportion_samples = 0.25,
  rare_exposure = 0.4,
  verbose = TRUE,
  combine_res = TRUE
)
```

## Arguments

musica	Input samples to predict signature weights
table_name	Name of table used for posterior prediction (e.g. SBS96)
signature_res	Signatures to automatically subset from for prediction
algorithm	Algorithm to use for prediction. Choose from "lda_posterior", and decompTumor2Sig
sample_annotation	Annotation to grid across, if none given, prediction subsetting on all samples together
min_exists	Threshold to consider a signature active in a sample
proportion_samples	Threshold of samples to consider a signature active in the cohort
rare_exposure	A sample will be considered active in the cohort if at least one sample has more than this threshold proportion
verbose	Print current annotation value being predicted on
combine_res	Automatically combines a list of annotation results into a single result object with zero exposure values for signatures not found in a given annotation's set of samples

**Value**

A list of results, one per unique annotation value, if no annotation value is given, returns a single result for all samples, or combines into a single result if combines\_res = TRUE

**Examples**

```
data(musica_annot)
data(cosmic_v2_sigs)
auto_predict_grid(musica = musica_annot, table_name = "SBS96",
signature_res = cosmic_v2_sigs, algorithm = "lda",
sample_annotation = "Tumor_Subtypes")
auto_predict_grid(musica_annot, "SBS96", cosmic_v2_sigs, "lda")
```

auto_subset_sigs	<i>Automatic filtering of inactive signatures</i>
------------------	---

**Description**

Automatic filtering of inactive signatures

**Usage**

```
auto_subset_sigs(
  musica,
  table_name,
  signature_res,
  algorithm,
  min_exists = 0.05,
  proportion_samples = 0.25,
  rare_exposure = 0.4
)
```

**Arguments**

<code>musica</code>	A <a href="#">musica</a> object.
<code>table_name</code>	Name of table used for posterior prediction (e.g. SBS96)
<code>signature_res</code>	Signatures to automatically subset from for prediction
<code>algorithm</code>	Algorithm to use for prediction. Choose from "lda_posterior" and decompTumor2Sig
<code>min_exists</code>	Threshold to consider a signature active in a sample
<code>proportion_samples</code>	Threshold of samples to consider a signature active in the cohort
<code>rare_exposure</code>	A sample will be considered active in the cohort if at least one sample has more than this threshold proportion

**Value**

A result object containing automatically subset signatures and corresponding sample weights

---

build\_custom\_table     *Builds a custom table from specified user variants*

---

## Description

Builds a custom table from specified user variants

## Usage

```
build_custom_table(  
  musica,  
  variant_annotation,  
  name,  
  description = character(),  
  data_factor = NA,  
  annotation_df = NULL,  
  features = NULL,  
  type = NULL,  
  color_variable = NULL,  
  color_mapping = NULL,  
  return_instead = FALSE,  
  overwrite = FALSE  
)
```

## Arguments

musica	A <a href="#">musica</a> object.
variant_annotation	User column to use for building table
name	Table name to refer to (must be unique)
description	Optional description of the table content
data_factor	Full set of table values, in case some are missing from the data. If NA, a superset of all available unique data values will be used
annotation_df	A data.frame of annotations to use for plotting
features	A data.frame of the input data from which the count table will be built
type	The type of data/mutation in each feature as an Rle object
color_variable	The name of the column of annotation_df used for the coloring in plots
color_mapping	The mapping from the values in the selected color_variable column to color values for plotting
return_instead	Instead of adding to musica object, return the created table
overwrite	Overwrite existing count table

**Value**

If `return_instead = TRUE` then the created table object is returned, otherwise the table object is automatically added to the `musica`'s `count_tables` list and nothing is returned

**Examples**

```
data(musica)
annotate_transcript_strand(musica, "19", build_table = FALSE)
build_custom_table(musica, "Transcript_Strand", "Transcript_Strand",
data_factor = factor(c("T", "U")))
```

`build_standard_table`   *Builds count tables using various mutation type schemas*

**Description**

Generates count tables for different mutation type schemas which can be used as input to the mutational signature discovery or prediction functions. "SBS96" generates a table for single base substitutions following the standard 96 mutation types derived from the trinucleotide context. "SBS192" is the 96 mutation type schema with the addition of transcriptional strand or replication strand information added to each base. "DBS" generates a table for the double base substitution schema used in COSMIC V3. "Indel" generates a table for insertions and deletions following the schema used in COSMIC V3.

**Usage**

```
build_standard_table(
  musica,
  g,
  table_name,
  strand_type = NULL,
  overwrite = FALSE,
  verbose = FALSE
)
```

**Arguments**

<code>musica</code>	A <code>musica</code> object.
<code>g</code>	A <code>BSgenome</code> object indicating which genome reference the variants and their coordinates were derived from.
<code>table_name</code>	Name of standard table to build. One of "SBS96", "SBS192", "DBS", or "Indel".
<code>strand_type</code>	Strand type to use in SBS192 schema. One of "Transcript_Strand" or "Replication_Strand". Only used if <code>table_name</code> = SBS192.
<code>overwrite</code>	If TRUE, any existing count table with the same name will be overwritten. If FALSE, then an error will be thrown if a table with the same name exists within the <code>musica</code> object.
<code>verbose</code>	Show progress bar for processed samples

**Value**

No object will be returned. The count tables will be automatically added to the `musica` object.

**Examples**

```
g <- select_genome("19")

data(musica)
build_standard_table(musica, g, "SBS96", overwrite = TRUE)

data(musica)
annotate_transcript_strand(musica, "19")
build_standard_table(musica, g, "SBS192", "Transcript_Strand")

data(musica)
data(rep_range)
annotate_replication_strand(musica, rep_range)
build_standard_table(musica, g, "SBS192", "Replication_Strand")

data(dbs_musica)
build_standard_table(dbs_musica, g, "DBS", overwrite = TRUE)

data(indel_musica)
build_standard_table(indel_musica, g, table_name = "INDEL")
```

**built\_tables**

*Retrieve the names of count\_tables from a `musica` or `musica_result` object*

**Description**

The `count_tables` contains standard and/or custom count tables created from variants

**Usage**

```
built_tables(object)

## S4 method for signature 'musica'
built_tables(object)

## S4 method for signature 'musica_result'
built_tables(object)
```

**Arguments**

<code>object</code>	A <code>musica</code> object generated by the <code>create_musica</code> function or a <code>musica_result</code> object generated by a mutational discovery or prediction tool.
---------------------	--

**Value**

The names of created count\_tables

**Examples**

```
data(res)
built_tables(res)
```

*cluster\_exposure*

*Perform clustering analysis from a musica result object*

**Description**

Proportional sample exposures will be used as input to perform clustering.

**Usage**

```
cluster_exposure(
  result,
  nclust,
  proportional = TRUE,
  method = "kmeans",
  dis.method = "euclidean",
  hc.method = "ward.D",
  clara.samples = 5,
  iter.max = 10,
  tol = 1e-15
)
```

**Arguments**

<code>result</code>	A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool.
<code>nclust</code>	Pre-defined number of clusters.
<code>proportional</code>	Logical, indicating if proportional exposure (default) will be used for clustering.
<code>method</code>	Clustering algorithms. Options are "kmeans" (K-means), "hkmeans" (hybrid of hierarchical K-means), "hclust" (hierarchical clustering), "pam" (PAM), and "clara" (Clara).
<code>dis.method</code>	Methods to calculate dissimilarity matrix. Options are "euclidean" (default), "manhattan", "jaccard", "cosine", and "canberra".
<code>hc.method</code>	Methods to perform hierarchical clustering. Options are "ward.D" (default), "ward.D2", "single", "complete", "average", "mcquitty", "median", and "centroid".
<code>clara.samples</code>	Number of samples to be drawn from dataset. Only used when "clara" is selected. Default is 5.
<code>iter.max</code>	Maximum number of iterations for k-means clustering.
<code>tol</code>	Tolerance level for kmeans clustering level iterations

**Value**

A one-column data frame with sample IDs as row names and cluster number for each sample.

**See Also**

[kmeans](#)

**Examples**

```
set.seed(123)
data(res_annot)
clust_out <- cluster_exposure(res_annot, nclust = 2)
```

---

combine\_count\_tables    *Combines tables into a single table that can be used for discovery/prediction*

---

**Description**

Combines tables into a single table that can be used for discovery/prediction

**Usage**

```
combine_count_tables(
  musica,
  to_comb,
  name,
  description = character(),
  color_variable = character(),
  color_mapping = character(),
  overwrite = FALSE
)
```

**Arguments**

musica	A <a href="#">musica</a> object.
to_comb	A vector of table names to combine. Each table must already exist within the input musica object
name	Name of table build, must be a new name
description	Description of the new table
color_variable	Annotation column to use for coloring plotted motifs, provided by counts table from input result's musica object
color_mapping	Mapping from color_variable to color names, provided by counts table from input result's musica object
overwrite	Overwrite existing count table

**Value**

None

**Examples**

```
g <- select_genome("19")

data(musica)
build_standard_table(musica, g, "SBS96", overwrite = TRUE)

annotate_transcript_strand(musica, "19")
build_standard_table(musica, g, "SBS192", "Transcript_Strand")

combine_count_tables(musica, c("SBS96", "SBS192_Trans"), "combo")
```

**combine\_predict\_grid**    *Combine prediction grid list into a result object. Exposure values are zero for samples in an annotation where that signature was not predicted*

**Description**

Combine prediction grid list into a result object. Exposure values are zero for samples in an annotation where that signature was not predicted

**Usage**

```
combine_predict_grid(grid_list, musica, table_name, signature_res)
```

**Arguments**

<b>grid_list</b>	A list of result objects from the prediction grid to combine into a single result
<b>musica</b>	A <a href="#">musica</a> object.
<b>table_name</b>	Table name used for prediction
<b>signature_res</b>	Signatures to automatically subset from for prediction

**Value**

A result object combining all samples and signatures from a prediction grid. Samples have zero exposure value for signatures not found in that annotation type.

## Examples

```
data(musica_annot)
data(cosmic_v2_sigs)
grid <- auto_predict_grid(musica_annot, "SBS96", cosmic_v2_sigs, "lda",
  "Tumor_Subtypes", combine_res = FALSE)
combined <- combine_predict_grid(grid, musica_annot, "SBS96", cosmic_v2_sigs)
plot_exposures(combined, group_by = "annotation",
  annotation="Tumor_Subtypes")
```

---

compare\_cosmic\_v2

*Compare a result object to COSMIC V2 SBS Signatures (combination whole-exome and whole-genome)*

---

## Description

Compare a result object to COSMIC V2 SBS Signatures (combination whole-exome and whole-genome)

## Usage

```
compare_cosmic_v2(
  result,
  threshold = 0.9,
  metric = "cosine",
  result_name = deparse(substitute(result)),
  decimals = 2,
  same_scale = FALSE
)
```

## Arguments

result	A <a href="#">musica_result</a> object.
threshold	threshold for similarity
metric	One of "cosine" for cosine similarity or "jsd" for 1 minus the Jensen-Shannon Divergence. Default "cosine".
result_name	title for plot user result signatures
decimals	Specifies rounding for similarity metric displayed. Default 2.
same_scale	If TRUE, the scale of the probability for each signature will be the same. If FALSE, then the scale of the y-axis will be adjusted for each signature. Default TRUE.

## Value

Returns the comparisons

## Examples

```
data(res)
compare_cosmic_v2(res, threshold = 0.7)
```

---

<code>compare_cosmic_v3</code>	<i>Compare a result object to COSMIC V3 Signatures; Select exome or genome for SBS and only genome for DBS or Indel classes</i>
--------------------------------	---

---

## Description

Compare a result object to COSMIC V3 Signatures; Select exome or genome for SBS and only genome for DBS or Indel classes

## Usage

```
compare_cosmic_v3(
  result,
  variant_class,
  sample_type,
  metric = "cosine",
  threshold = 0.9,
  result_name = deparse(substitute(result)),
  decimals = 2,
  same_scale = FALSE
)
```

## Arguments

<code>result</code>	A <a href="#">musica_result</a> object.
<code>variant_class</code>	Compare to SBS, DBS, or Indel
<code>sample_type</code>	exome (SBS only) or genome
<code>metric</code>	One of "cosine" for cosine similarity or "jsd" for 1 minus the Jensen-Shannon Divergence. Default "cosine".
<code>threshold</code>	threshold for similarity
<code>result_name</code>	title for plot user result signatures
<code>decimals</code>	Specifies rounding for similarity metric displayed. Default 2.
<code>same_scale</code>	If TRUE, the scale of the probability for each signature will be the same. If FALSE, then the scale of the y-axis will be adjusted for each signature. Default TRUE.

## Value

Returns the comparisons

## Examples

```
data(res)
compare_cosmic_v3(res, "SBS", "genome", threshold = 0.8)
```

---

compare_results	<i>Compare two result files to find similar signatures</i>
-----------------	--

---

## Description

Compare two result files to find similar signatures

## Usage

```
compare_results(  
  result,  
  other_result,  
  threshold = 0.9,  
  metric = "cosine",  
  result_name = deparse(substitute(result)),  
  other_result_name = deparse(substitute(other_result)),  
  decimals = 2,  
  same_scale = FALSE  
)
```

## Arguments

result	A <code>musica_result</code> object.
other_result	A second <code>musica_result</code> object.
threshold	threshold for similarity
metric	One of "cosine" for cosine similarity or "jsd" for 1 minus the Jensen-Shannon Divergence. Default "cosine".
result_name	title for plot of first result signatures
other_result_name	title for plot of second result signatures
decimals	Specifies rounding for similarity metric displayed. Default 2.
same_scale	If TRUE, the scale of the probability for each signature will be the same. If FALSE, then the scale of the y-axis will be adjusted for each signature. Default FALSE.

## Value

Returns the comparisons

## Examples

```
data(res)  
compare_results(res, res, threshold = 0.8)
```

`cosmic_v2_sigs`      *COSMIC v2 SBS96 Signatures Result Object*

### Description

Data from COSMIC formatted to be used for prediction with individual tumors and cohorts.

### Usage

```
data(cosmic_v2_sigs)
```

### Format

An object of class `musica_result` See [predict\_exposure()].

### Source

COSMIC v2, <[https://cancer.sanger.ac.uk/cosmic/signatures\\_v2](https://cancer.sanger.ac.uk/cosmic/signatures_v2)>

### References

Alexandrov, L., Nik-Zainal, S., Wedge, D. et al. (2013) Signatures of mutational processes in human cancer. *Nature* 500, 415–421 ([Nature](<https://www.ncbi.nlm.nih.gov/pubmed/23945592>))

`cosmic_v2_subtype_map` *Input a cancer subtype to return a list of related COSMIC signatures*

### Description

Input a cancer subtype to return a list of related COSMIC signatures

### Usage

```
cosmic_v2_subtype_map(tumor_type)
```

### Arguments

<code>tumor_type</code>	Cancer subtype to view related signatures
-------------------------	---

### Value

Returns signatures related to a partial string match

### Examples

```
cosmic_v2_subtype_map ("lung")
```

---

---

count_table-class	<i>Object containing the count table matrices, their names and descriptions that we generated by provided and by user functions. These are used to discover and infer signatures and exposures.</i>
-------------------	---

---

**Description**

Object containing the count table matrices, their names and descriptions that we generated by provided and by user functions. These are used to discover and infer signatures and exposures.

**Slots**

**name** A name that describes the type of table (e.g. "SBS96")  
**count\_table** An array of counts with samples as the columns and motifs as the rows  
**annotation** A data.frame of annotations with three columns used for plotting: motif, mutation, and context  
**features** Original features used to generate the count\_table  
**type** The mutation type of each feature, in case we need to plot or model them differently  
**color\_variable** The variable used for plotting colors, selected from the annotation slot  
**color\_mapping** The mapping of the annotations chosen by color\_variable to color values for plotting  
**description** A summary table of the result objects in result\_list a list of lists. The nested lists created combined (rbind) tables, and the tables at the first list level are modelled independently. Combined tables must be named. list("tableA", comboTable = list("tableC", "tableD"))

---

create_dbs78_table	<i>Creates and adds a table for standard doublet base substitution (DBS)</i>
--------------------	--

---

**Description**

Creates and adds a table for standard doublet base substitution (DBS)

**Usage**

```
create_dbs78_table(musica, overwrite = overwrite, verbose)
```

**Arguments**

<b>musica</b>	A <a href="#">musica</a> object.
<b>overwrite</b>	Overwrite existing count table

**Value**

Returns the created DBS table object

---

<code>create_musica</code>	<i>Creates a musica object from a variant table</i>
----------------------------	---

---

## Description

This function creates a `musica` object from a variant table or matrix. The `musica` class stores variants information, variant-level annotations, sample-level annotations, and count tables and is used as input to the mutational signature discovery and prediction algorithms. The input variant table or matrix must have columns for chromosome, start position, end position, reference allele, alternate allele, and sample names. The column names in the variant table can be mapped using the `chromosome_col`, `start_col`, `end_col`, `ref_col`, `alt_col`, and `sample_col` parameters.

## Usage

```
create_musica(
  x,
  genome,
  check_ref_chromosomes = TRUE,
  check_ref_bases = TRUE,
  chromosome_col = "chr",
  start_col = "start",
  end_col = "end",
  ref_col = "ref",
  alt_col = "alt",
  sample_col = "sample",
  extra_fields = NULL,
  standardize_indels = TRUE,
  convert_dbs = TRUE,
  verbose = TRUE
)
```

## Arguments

- `x` A `data.table`, `matrix`, or `data.frame` that contains columns with the variant information.
- `genome` A `BSgenome` object indicating which genome reference the variants and their coordinates were derived from.
- `check_ref_chromosomes` Whether to perform a check to ensure that the chromosomes in the variant object match the reference chromosomes in the genome object. If there are mismatches, this may cause errors in downstream generation of count tables. If mismatches occur, an attempt to automatically fix these with the `seqlevelsStyle` function will be made. Default `TRUE`.
- `check_ref_bases` Whether to check if the reference bases in the variant object match the reference bases in the genome object. Default `TRUE`.

chromosome_col	The name of the column that contains the chromosome reference for each variant. Default "chr".
start_col	The name of the column that contains the start position for each variant. Default "start".
end_col	The name of the column that contains the end position for each variant. Default "end".
ref_col	The name of the column that contains the reference base(s) for each variant. Default "ref".
alt_col	The name of the column that contains the alternative base(s) for each variant. Default "alt".
sample_col	The name of the column that contains the sample id for each variant. Default "sample".
extra_fields	Which additional fields to extract and include in the musica object. Default NULL.
standardize_indels	Flag to convert indel style (e.g. 'C > CAT' becomes '-' > AT' and 'GCACA > G' becomes 'CACAC > -')
convert_dbs	Flag to convert adjacent SBS into DBS (original SBS are removed)
verbose	Whether to print status messages during error checking. Default TRUE.

**Value**

Returns a musica object

**Examples**

```
maf_file <- system.file("extdata", "public_TCGA.LUSC.maf",
package = "musicatk")
variants <- extract_variants_from_maf_file(maf_file)
g <- select_genome("38")
musica <- create_musica(x = variants, genome = g)
```

`create_sbs192_table`    *Uses a genome object to find context and generate standard SBS192 table using transcript strand*

**Description**

Uses a genome object to find context and generate standard SBS192 table using transcript strand

**Usage**

```
create_sbs192_table(musica, g, strand_type, overwrite = FALSE)
```

**Arguments**

<code>musica</code>	Input samples
<code>g</code>	A <code>BSgenome</code> object indicating which genome reference the variants and their coordinates were derived from.
<code>strand_type</code>	Transcript_Strand or Replication_Strand
<code>overwrite</code>	Overwrite existing count table

**Value**

Returns the created SBS192 count table object built using either transcript strand or replication strand

<code>create_sbs96_table</code>	<i>Uses a genome object to find context and generate standard SBS96 tables</i>
---------------------------------	--

**Description**

Uses a genome object to find context and generate standard SBS96 tables

**Usage**

```
create_sbs96_table(musica, g, overwrite = FALSE)
```

**Arguments**

<code>musica</code>	A <code>musica</code> object.
<code>g</code>	A <code>BSgenome</code> object indicating which genome reference the variants and their coordinates were derived from.
<code>overwrite</code>	Overwrite existing count table

**Value**

Returns the created SBS96 count table object

---

**create\_umap***Create a UMAP from a musica result*

---

**Description**

Proportional sample exposures will be used as input into the [umap](#) function to generate a two dimensional UMAP.

**Usage**

```
create_umap(result, n_neighbors = 30, min_dist = 0.75, spread = 1)
```

**Arguments**

<code>result</code>	A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool.
<code>n_neighbors</code>	The size of local neighborhood used for views of manifold approximation. Larger values result in more global the manifold, while smaller values result in more local data being preserved. If <code>n_neighbors</code> is larger than the number of samples, then <code>n_neighbors</code> will automatically be set to the number of samples in the <a href="#">musica_result</a> . Default 30.
<code>min_dist</code>	The effective minimum distance between embedded points. Smaller values will result in a more clustered/clumped embedding where nearby points on the manifold are drawn closer together, while larger values will result on a more even dispersal of points. Default 0.2.
<code>spread</code>	The effective scale of embedded points. In combination with ‘ <code>min_dist</code> ’, this determines how clustered/clumped the embedded points are. Default 1.

**Value**

A [musica\\_result](#) object with a new UMAP stored in the UMAP slot.

**See Also**

See [plot\\_umap](#) to display the UMAP and [umap](#) for more information on the individual parameters for generating UMAPs.

**Examples**

```
data(res_annot)
create_umap(result = res_annot)
```

**dbs\_musica***dbs\_musica***Description**

A musica created for testing that includes DBS variants

**Usage**

```
data(dbs_musica)
```

**Format**

An object of class `musica`. See [create\_musica()].

**discover\_signatures***Discover mutational signatures***Description**

Mutational signatures and exposures will be discovered using methods such as Latent Dirichlet Allocation (lda) or Non-Negative Matrix Factorization (nmf). These algorithms will deconvolute a matrix of counts for mutation types in each sample to two matrices: 1) a "signature" matrix containing the probability of each mutation type in each sample and 2) an "exposure" matrix containing the estimated counts for each signature in each sample. Before mutational discovery can be performed, variants from samples first need to be stored in a `musica` object using the `create_musica` function and mutation count tables need to be created using functions such as `build_standard_table`.

**Usage**

```
discover_signatures(
  musica,
  table_name,
  num_signatures,
  algorithm = "lda",
  seed = 1,
  nstart = 10,
  par_cores = 1
)
```

**Arguments**

<code>musica</code>	A <a href="#">musica</a> object.
<code>table_name</code>	Name of the table to use for signature discovery. Needs to be the same name supplied to the table building functions such as <a href="#">build_standard_table</a> .
<code>num_signatures</code>	Number of signatures to discover.
<code>algorithm</code>	Method to use for mutational signature discovery. One of "lda" or "nmf". Default "lda".
<code>seed</code>	Seed to be used for the random number generators in the signature discovery algorithms. Default 1.
<code>nstart</code>	Number of independent random starts used in the mutational signature algorithms. Default 10.
<code>par_cores</code>	Number of parallel cores to use. Only used if <code>method = "nmf"</code> . Default 1.

**Value**

Returns a A [musica\\_result](#) object containing signatures and exposures.

**Examples**

```
data(musica)
g <- select_genome("19")
build_standard_table(musica, g, "SBS96", overwrite = TRUE)
discover_signatures(musica = musica, table_name = "SBS96",
num_signatures = 3, algorithm = "lda", seed = 12345, nstart = 1)
```

<code>drop_annotation</code>	<i>Drops a column from the variant table that the user no longer needs</i>
------------------------------	--

**Description**

Drops a column from the variant table that the user no longer needs

**Usage**

```
drop_annotation(musica, column_name)
```

**Arguments**

<code>musica</code>	A <a href="#">musica</a> object.
<code>column_name</code>	Name of column to drop

**Value**

None

## Examples

```
data(musica)
drop_annotation(musica, "Variant_Type")
```

**exposures**

*Retrieve exposures from a musica\_result object*

## Description

The exposure matrix contains estimated amount of each signature for each sample. Rows correspond to each signature and columns correspond to each sample.

## Usage

```
exposures(result)

## S4 method for signature 'musica_result'
exposures(result)

exposures(result) <- value

## S4 replacement method for signature 'musica_result,matrix'
exposures(result) <- value
```

## Arguments

<b>result</b>	A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool.
<b>value</b>	A matrix of samples by signature exposures

## Value

A matrix of exposures

## Examples

```
data(res)
exposures(res)
data(res)
exposures(res) <- matrix()
```

---

```
exposure_differential_analysis
    Compare exposures of annotated samples
```

---

## Description

`exposure_differential_analysis` is used to run differential analysis on the signature exposures of annotated samples within the `musica_result` object.

## Usage

```
exposure_differential_analysis(
  musica_result,
  annotation,
  method = c("wilcox", "kruskal", "glm.nb"),
  group1 = NULL,
  group2 = NULL,
  ...
)
```

## Arguments

<code>musica_result</code>	A <code>musica_result</code> object
<code>annotation</code>	Column in the <code>sample_annotations</code> table of the <code>musica_result</code> object
<code>method</code>	Any method in <code>c("wilcox", "kruskal", "glm.nb")</code> used to perform differential analysis on signature exposures
<code>group1</code>	character vector used in the Wilcox test. Elements in <code>group1</code> are compared to elements in <code>group2</code> . This is required for annotation with more than 2 levels.
<code>group2</code>	character vector used in the Wilcox test. Elements in <code>group2</code> are compared to elements in <code>group1</code> . This is required for annotation with more than 2 levels.
<code>...</code>	Additional arguments to be passed to the chosen method

## Value

A matrix containing statistics summarizing the analysis dependent on the chosen method

## Examples

```
data("res_annot")
exposure_differential_analysis(res_annot, "Tumor_Subtypes", method="wilcox")
```

`extract_count_tables`    *Extract count tables list from a musica object*

### Description

Extract count tables list from a musica object

### Usage

```
extract_count_tables(musica)
```

### Arguments

musica	A <code>musica</code> object.
--------	-------------------------------

### Value

List of count tables objects

### Examples

```
data(musica)
extract_count_tables(musica)
```

`extract_variants`    *Extract variants from multiple objects*

### Description

Chooses the correct function to extract variants from input based on the class of the object or the file extension. Different types of objects can be mixed within the list. For example, the list can include VCF files and maf objects. Certain parameters such as `id` and `rename` only apply to VCF objects or files and need to be individually specified for each VCF. Therefore, these parameters should be supplied as a vector that is the same length as the number of inputs. If other types of objects are in the input list, then the value of `id` and `rename` will be ignored for these items.

### Usage

```
extract_variants(
  inputs,
  id = NULL,
  rename = NULL,
  sample_field = NULL,
  filename_as_id = FALSE,
  strip_extension = c(".vcf", ".vcf.gz", ".gz"),
  filter = TRUE,
```

```

multiallele = c("expand", "exclude"),
fix_vcf_errors = TRUE,
extra_fields = NULL,
chromosome_col = "chr",
start_col = "start",
end_col = "end",
ref_col = "ref",
alt_col = "alt",
sample_col = "sample",
verbose = TRUE
)

```

## Arguments

inputs	A vector or list of objects or file names. Objects can be <a href="#">CollapsedVCF</a> , <a href="#">ExpandedVCF</a> , <a href="#">MAF</a> , an object that inherits from <code>matrix</code> or <code>data.frame</code> , or character strings that denote the path to a vcf or maf file.
id	A character vector the same length as <code>inputs</code> denoting the sample to extract from a vcf. See <a href="#">extract_variants_from_vcf</a> for more details. Only used if the input is a vcf object or file. Default <code>NULL</code> .
rename	A character vector the same length as <code>inputs</code> denoting what the sample will be renamed to. See <a href="#">extract_variants_from_vcf</a> for more details. Only used if the input is a vcf object or file. Default <code>NULL</code> .
sample_field	Some algorithms will save the name of the sample in the <code>##SAMPLE</code> portion of header in the VCF. See <a href="#">extract_variants_from_vcf</a> for more details. Default <code>NULL</code> .
filename_as_id	If set to <code>TRUE</code> , the file name will be used as the sample name. See <a href="#">extract_variants_from_vcf_file</a> for more details. Only used if the input is a vcf file. Default <code>TRUE</code> .
strip_extension	Only used if <code>filename_as_id</code> is set to <code>TRUE</code> . If set to <code>TRUE</code> , the file extension will be stripped from the filename before setting the sample name. See <a href="#">extract_variants_from_vcf_file</a> for more details. Only used if the input is a vcf file. Default <code>c(".vcf", ".vcf.gz", ".gz")</code>
filter	Exclude variants that do not have a <code>PASS</code> in the <code>FILTER</code> column of VCF inputs.
multiallele	Multialleles are when multiple alternative variants are listed in the same row in the vcf. See <a href="#">extract_variants_from_vcf</a> for more details. Only used if the input is a vcf object or file. Default <code>"expand"</code> .
fix_vcf_errors	Attempt to automatically fix VCF file formatting errors. See <a href="#">extract_variants_from_vcf_file</a> for more details. Only used if the input is a vcf file. Default <code>TRUE</code> .
extra_fields	Optionally extract additional fields from all input objects. Default <code>NULL</code> .
chromosome_col	The name of the column that contains the chromosome reference for each variant. Only used if the input is a <code>matrix</code> or <code>data.frame</code> . Default <code>"Chromosome"</code> .
start_col	The name of the column that contains the start position for each variant. Only used if the input is a <code>matrix</code> or <code>data.frame</code> . Default <code>"Start_Position"</code> .
end_col	The name of the column that contains the end position for each variant. Only used if the input is a <code>matrix</code> or <code>data.frame</code> . Default <code>"End_Position"</code> .

<code>ref_col</code>	The name of the column that contains the reference base(s) for each variant. Only used if the input is a matrix or data.frame. Default "Tumor_Seq_Allele1".
<code>alt_col</code>	The name of the column that contains the alternative base(s) for each variant. Only used if the input is a matrix or data.frame. Default "Tumor_Seq_Allele2".
<code>sample_col</code>	The name of the column that contains the sample id for each variant. Only used if the input is a matrix or data.frame. Default "sample".
<code>verbose</code>	Show progress of variant extraction. Default TRUE.

**Value**

Returns a data.table of variants from a vcf

**Examples**

```
# Get locations of two vcf files and a maf file
luad_vcf_file <- system.file("extdata", "public_LUAD_TCGA-97-7938.vcf",
package = "musicatk")
lusc_maf_file <- system.file("extdata", "public_TCGA.LUSC.maf",
package = "musicatk")
melanoma_vcfs <- list.files(system.file("extdata", package = "musicatk"),
pattern = glob2rx("*SKCM*vcf"), full.names = TRUE)

# Read all files in at once
inputs <- c(luad_vcf_file, melanoma_vcfs, lusc_maf_file)
variants <- extract_variants(inputs = inputs)
table(variants$sample)

# Run again but renaming samples in first four vcfs
new_name <- c(paste0("Sample", 1:4), NA)
variants <- extract_variants(inputs = inputs, rename = new_name)
table(variants$sample)
```

**extract\_variants\_from\_maf**

*Extract variants from a maf object*

**Description**

Add description

**Usage**

```
extract_variants_from_maf(maf, extra_fields = NULL)
```

**Arguments**

<code>maf</code>	MAF object loaded by <code>read.maf()</code> from the 'maftools' package
<code>extra_fields</code>	Optionally extract additional columns from the maf object. Default NULL.

**Value**

Returns a data.table of variants from a maf which can be used to create a musica object.

**Examples**

```
maf_file <- system.file("extdata", "public_TCGA.LUSC.maf",
package = "musicatk")
library(mafftools)
maf <- read.maf(maf_file)
variants <- extract_variants_from_maf(maf = maf)
```

---

**extract\_variants\_from\_maf\_file**  
*Extracts variants from a maf file*

---

**Description**

Add Description - Aaron

**Usage**

```
extract_variants_from_maf_file(maf_file, extra_fields = NULL)
```

**Arguments**

**maf\_file** Location of maf file

**extra\_fields** Optionally extract additional columns from the object. Default NULL.

**Value**

Returns a data.table of variants from a maf

**Examples**

```
maf_file <- system.file("extdata", "public_TCGA.LUSC.maf",
package = "musicatk")
maf <- extract_variants_from_maf_file(maf_file = maf_file)
```

**extract\_variants\_from\_matrix***Extract variants from matrix or data.frame like objects*

---

**Description**

Add Description

**Usage**

```
extract_variants_from_matrix(
  mat,
  chromosome_col = "Chromosome",
  start_col = "Start_Position",
  end_col = "End_Position",
  ref_col = "Tumor_Seq_Allele1",
  alt_col = "Tumor_Seq_Allele2",
  sample_col = "Tumor_Sample_Barcode",
  extra_fields = NULL
)
```

**Arguments**

<code>mat</code>	An object that inherits from classes "matrix" or "data.frame". Examples include a matrix, data.frame, or data.table.
<code>chromosome_col</code>	The name of the column that contains the chromosome reference for each variant. Default "Chromosome".
<code>start_col</code>	The name of the column that contains the start position for each variant. Default "Start_Position".
<code>end_col</code>	The name of the column that contains the end position for each variant. Default "End_Position".
<code>ref_col</code>	The name of the column that contains the reference base(s) for each variant. Default "Tumor_Seq_Allele1".
<code>alt_col</code>	The name of the column that contains the alternative base(s) for each variant. Default "Tumor_Seq_Allele2".
<code>sample_col</code>	The name of the column that contains the sample id for each variant. Default "Tumor_Sample_Barcode".
<code>extra_fields</code>	Optionally extract additional columns from the object. Default NULL.

**Value**

Returns a data.table of variants from a maf which can be used to create a musica object.

## Examples

```
maf_file <- system.file("extdata", "public_TCGA.LUSC.maf",
package = "musicatk")
library(mafftools)
maf <- read.maf(maf_file)
variants <- extract_variants_from_maf(maf = maf)
variants <- extract_variants_from_matrix(mat = variants,
chromosome_col = "chr", start_col = "start", end_col = "end",
ref_col = "ref", alt_col = "alt", sample_col = "sample")
```

### extract\_variants\_from\_vcf

*Extracts variants from a VariantAnnotation VCF object*

## Description

Aaron - Need to describe difference between ID, and name in the header, and rename in terms of naming the sample. Need to describe differences in multiallelic choices. Also need to describe the automatic error fixing

## Usage

```
extract_variants_from_vcf(
  vcf,
  id = NULL,
  rename = NULL,
  sample_field = NULL,
  filter = TRUE,
  multiallele = c("expand", "exclude"),
  extra_fields = NULL
)
```

## Arguments

vcf	Location of vcf file
id	ID of the sample to select from VCF. If NULL, then the first sample will be selected. Default NULL.
rename	Rename the sample to this value when extracting variants. If NULL, then the sample will be named according to ID.
sample_field	Some algorithms will save the name of the sample in the ##SAMPLE portion of header in the VCF (e.g. ##SAMPLE=<ID=TUMOR,SampleName=TCGA-01-0001>). If the ID is specified via the id parameter ("TUMOR" in this example), then sample_field can be used to specify the name of the tag ("SampleName" in this example). Default NULL.
filter	Exclude variants that do not have a PASS in the FILTER column of the VCF. Default TRUE.

multiallele	Multialleles are when multiple alternative variants are listed in the same row in the vcf. One of "expand" or "exclude". If "expand" is selected, then each alternate allele will be given their own rows. If "exclude" is selected, then these rows will be removed. Default "expand".
extra_fields	Optionally extract additional fields from the INFO section of the VCF. Default NULL.

**Value**

Returns a data.table of variants from a vcf

**Examples**

```
vcf_file <- system.file("extdata", "public_LUAD_TCGA-97-7938.vcf",
  package = "musicatk")

library(VariantAnnotation)
vcf <- readVcf(vcf_file)
variants <- extract_variants_from_vcf(vcf = vcf)
```

**extract\_variants\_from\_vcf\_file**  
*Extracts variants from a vcf file*

**Description**

Add Description

**Usage**

```
extract_variants_from_vcf_file(
  vcf_file,
  id = NULL,
  rename = NULL,
  sample_field = NULL,
  filename_as_id = FALSE,
  strip_extension = c(".vcf", ".vcf.gz", ".gz"),
  filter = TRUE,
  multiallele = c("expand", "exclude"),
  extra_fields = NULL,
  fix_vcf_errors = TRUE
)
```

### Arguments

vcf_file	Path to the vcf file
id	ID of the sample to select from VCF. If NULL, then the first sample will be selected. Default NULL.
rename	Rename the sample to this value when extracting variants. If NULL, then the sample will be named according to ID.
sample_field	Some algorithms will save the name of the sample in the ##SAMPLE portion of header in the VCF (e.g. ##SAMPLE=<ID=TUMOR,SampleName=TCGA-01-0001>). If the ID is specified via the id parameter ("TUMOR" in this example), then sample_field can be used to specify the name of the tag ("SampleName" in this example). Default NULL.
filename_as_id	If set to TRUE, the file name will be used as the sample name.
strip_extension	Only used if filename_as_id is set to TRUE. If set to TRUE, the file extention will be stripped from the filename before setting the sample name. If a character vector is given, then all the strings in the vector will removed from the end of the filename before setting the sample name. Default c(".vcf", ".vcf.gz", ".gz")
filter	Exclude variants that do not have a PASS in the FILTER column of the VCF. Default TRUE.
multiallele	Multialleles are when multiple alternative variants are listed in the same row in the vcf. One of "expand" or "exclude". If "expand" is selected, then each alternate allele will be given their own rows. If "exclude" is selected, then these rows will be removed. Default "expand".
extra_fields	Optionally extract additional fields from the INFO section of the VCF. Default NULL.
fix_vcf_errors	Attempt to automatically fix VCF file formatting errors.

### Value

Returns a data.table of variants extracted from a vcf

### Examples

```
vcf <- system.file("extdata", "public_LUAD_TCGA-97-7938.vcf",
  package = "musicatk")
variants <- extract_variants_from_vcf_file(vcf_file = vcf)
```

generate\_result\_grid *Generate result\_grid from musica based on annotation and range of k*

### Description

Generate result\_grid from musica based on annotation and range of k

**Usage**

```
generate_result_grid(
  musica,
  table_name,
  algorithm = "lda",
  annotation = NA,
  k_start,
  k_end,
  n_start = 1,
  seed = NULL,
  par_cores = FALSE,
  verbose = FALSE
)
```

**Arguments**

<code>musica</code>	A <a href="#">musica</a> object.
<code>table_name</code>	Name of table used for signature discovery
<code>algorithm</code>	Algorithm for signature discovery
<code>annotation</code>	Sample annotation to split results into
<code>k_start</code>	Lower range of number of signatures for discovery
<code>k_end</code>	Upper range of number of signatures for discovery
<code>n_start</code>	Number of times to discover signatures and compare based on posterior loglikelihood
<code>seed</code>	Seed to use for reproducible results, set to null to disable
<code>par_cores</code>	Number of parallel cores to use (NMF only)
<code>verbose</code>	Whether to output loop iterations

**Value**

A result object containing signatures and sample weights

**Examples**

```
data(musica_sbs96)
grid <- generate_result_grid(musica_sbs96, "SBS96", "lda", k_start = 2,
k_end = 5)
```

---

get_musica	<i>Retrieve musica from a musica_result object</i>
------------	--

---

### Description

The `musica` `musica` contains variants, count tables, and sample annotations

### Usage

```
get_musica(result)

## S4 method for signature 'musica_result'
get_musica(result)
```

### Arguments

`result` A `musica_result` object generated by a mutational discovery or prediction tool.

### Value

A `musica` `musica` object

### Examples

```
data(res)
get_musica(res)
```

---

indel_musica	<i>indel_musica</i>
--------------	---------------------

---

### Description

A `musica` created for testing that includes INDEL variants

### Usage

```
data(indel_musica)
```

### Format

An object of class `musica` See [create\_musica()].

**k\_select***Plots for helping decide number of clusters***Description**

To help decide the number of cluster, three different methods are provided: total within cluster sum of squares, average silhouette coefficient, and gap statistics.

**Usage**

```
k_select(
  result,
  method = "wss",
  clust.method = "kmeans",
  n = 10,
  proportional = TRUE
)
```

**Arguments**

<code>result</code>	A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool.
<code>method</code>	A single character string indicating which statistic to use for plot. Options are "wss" (total within cluster sum of squares), "silhouette" (average silhouette coefficient), and "gap_stat" (gap statistic). Default is "wss".
<code>clust.method</code>	A character string indicating clustering method. Options are "kmeans" (default), "hclust" (hierarchical clustering), "hkmeans", "pam", and "clara".
<code>n</code>	An integer indicating maximum number of clusters to test. Default is 10.
<code>proportional</code>	Logical, indicating if proportional exposure (default) will be used for clustering.

**Value**

A ggplot object.

**See Also**

[fviz\\_nbclust](#)

**Examples**

```
data(res_annotation)
set.seed(123)
#Make an elbow plot
k_select(res_annotation, method = "wss", n = 6)
#Plot average silhouette coefficient against number of clusters
k_select(res_annotation, method = "silhouette", n = 6)
#Plot gap statistics against number of clusters
k_select(res_annotation, method = "gap_stat", n = 6)
```

---

**musica***musica*

---

**Description**

A musica created for testing that includes SBS variants

**Usage**

```
data(musica)
```

**Format**

An object of class `musica` See [create\_musica()].

---

**musica-class**

*The primary object that contains variants, count\_tables, and samples annotations*

---

**Description**

The primary object that contains variants, count\_tables, and samples annotations

**Slots**

`variants` `data.table` of variants

`count_tables` Summary table with per-sample unnormalized motif counts

`sample_annotations` Sample-level annotations (e.g. age, sex, primary)

---

**musicatk**

*Starts the musicatk interactive Shiny app*

---

**Description**

The musicatk Shiny app allows users to perform mutational signature analysis using an interative graphical user interface (GUI)

**Usage**

```
musicatk(include_version = TRUE, theme = "yeti")
```

**Arguments**

include_version	Include the version number in the header. Default TRUE.
theme	The theme to use for the GUI. Default "yeti".

**Value**

The shiny app will open. No data will be returned.

**Examples**

```
## Not run:  
# Start the app  
musicatk()  
  
## End(Not run)
```

---

**musica\_annot**

---

*musica\_annot*

---

**Description**

A musica created for testing that includes SBS variants and sample annotations

**Usage**

```
data(musica_annot)
```

**Format**

An object of class `musica` See [create\_musica()].

---

**musica\_result-class**    *Object containing deconvolved/predicted signatures, sample weights, and the musica object the result was generated from*

---

**Description**

Object containing deconvolved/predicted signatures, sample weights, and the `musica` object the result was generated from

**Slots**

`signatures` A matrix of signatures by mutational motifs  
`exposures` A matrix of samples by signature weights  
`table_name` A character vector of table names used to make the result  
`algorithm` Describes how the signatures/weights were generated  
`musica` The musica object the results were generated from  
`umap` List of umap data.frames for plotting and analysis

---

**musica\_result\_grid-class**

*Object containing the result objects generated from the combination of annotations and a range of k values*

---

**Description**

Object containing the result objects generated from the combination of annotations and a range of k values

**Slots**

`grid_params` The parameters the result grid was created using  
`result_list` A list of result objects with different parameters  
`grid_table` A summary table of the result objects in result\_list

---

**musica\_sbs96**

*musica\_sbs96*

---

**Description**

A musica created for testing that includes SBS variants and a build counts table for them

**Usage**

```
data(musica_sbs96)
```

**Format**

An object of class `musica` See [build\_standard\_table()].

`musica_sbs96_tiny`      *musica\_sbs96\_tiny*

### Description

A very small musica created for testing that includes SBS variants and a build counts table for them

### Usage

```
data(musica_sbs96_tiny)
```

### Format

An object of class `musica` See [`build_standard_table()`].

`name_signatures`      *Return sample from musica object*

### Description

Return sample from `musica` object

### Usage

```
name_signatures(result, name_vector)
```

### Arguments

<code>result</code>	Result object containing signatures and weights
<code>name_vector</code>	Vector of user-defined signature names

### Value

Result object with user-defined signatures names

### Examples

```
data(res)
name_signatures(res, c("smoking", "apobec", "unknown"))
```

---

plot_cluster	<i>Visualize clustering results</i>
--------------	-------------------------------------

---

## Description

The clustering results can be visualized on a UMAP panel. Three different types of plots can be generated using this function: cluster-by-signature plot, cluster-by-annotation plot, and a single UMAP plot.

## Usage

```
plot_cluster(  
  result,  
  clusters,  
  group = "signature",  
  annotation = NULL,  
  plotly = TRUE  
)
```

## Arguments

result	A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool. A two-dimensional UMAP has to be stored in this object.
clusters	The result generated from cluster_exposure function.
group	A single character string indicating the grouping factor. Possible options are: "signature" (columns are signatures in a grid), "annotation" (columns are sample annotation), and "none" (a single UMAP plot). Default is "signature".
annotation	Column name of annotation.
plotly	If TRUE, the plot will be made interactive using plotly.

## Value

Generate a ggplot or plotly object.

## See Also

[create\\_umap](#)

## Examples

```
set.seed(123)  
data(res_annot)  
#Get clustering result  
clust_out <- cluster_exposure(result = res_annot, nclust = 2)  
#UMAP  
create_umap(result = res_annot)  
#generate cluster X signature plot
```

```
plot_cluster(result = res_annot, clusters = clust_out, group = "signature")
#generate cluster X annotation plot
plot_cluster(result = res_annot, clusters = clust_out, group = "annotation",
             annotation = "Tumor_Subtypes")
#generate a single UMAP plot
plot_cluster(result = res_annot, clusters = clust_out, group = "none")
```

**plot\_differential\_analysis***Compare exposures of annotated samples***Description**

`plot_differential_analysis` is used to plot differential analysis created by `exposure_differential_analysis`.

**Usage**

```
plot_differential_analysis(analysis, analysis_type, samp_num)
```

**Arguments**

<code>analysis</code>	Analysis created by <code>exposure_differential_analysis</code>
<code>analysis_type</code>	Currently only " <code>glm</code> " supported
<code>samp_num</code>	Number of samples that went into the analysis

**Value**

Generates a ggplot object

**Examples**

```
data("res_annot")
analysis <- exposure_differential_analysis(res_annot, "Tumor_Subtypes",
                                              method="wilcox")
plot_differential_analysis(analysis, "glm", 2)
```

---

plot_exposures	<i>Display sample exposures with bar, box, or violin plots</i>
----------------	--

---

## Description

The distributions of mutational signatures can be viewed with barplots or box/violin plots. Barplots are most useful for viewing the proportion of signatures within and across samples. The box/violin plots are most useful for viewing the distributions of signatures with respect to sample annotations. Samples can be grouped using the group\_by parameter. For barplots, various methods of sorting samples from left to right can be chosen using the sort\_samples parameter.

## Usage

```
plot_exposures(  
  result,  
  plot_type = c("bar", "box", "violin"),  
  proportional = FALSE,  
  group_by = "none",  
  color_by = c("signature", "annotation"),  
  annotation = NULL,  
  num_samples = NULL,  
  sort_samples = "total",  
  threshold = NULL,  
  same_scale = FALSE,  
  add_points = FALSE,  
  point_size = 2,  
  label_x_axis = FALSE,  
  legend = TRUE,  
  plotly = FALSE  
)
```

## Arguments

result	A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool.
plot_type	One of "bar", "box", or "violin". Default "bar".
proportional	If TRUE, then the exposures will be normalized to between 0 and 1 by dividing by the total number of counts for each sample. Default FALSE.
group_by	Determines how to group samples into the subplots (i.e. facets). One of "none", "signature" or "annotation". If set to "annotation", then a sample annotation must be supplied via the annotation parameter. Default "none".
color_by	Determines how to color the bars or box/violins. One of "signature" or "annotation". If set to "annotation", then a sample annotation must be supplied via the annotation parameter. Default "signature".
annotation	Sample annotation used to group the subplots and/or color the bars, boxes, or violins. Default NULL.

<code>num_samples</code>	The top number of sorted samples to display. If NULL, then all samples will be displayed. If <code>group_by</code> is set, then the top samples will be shown within each group. Default NULL.
<code>sort_samples</code>	This is used to change how samples are sorted in the barplot from left to right. If set to "total", then samples will be sorted from those with the highest number of mutation counts to the lowest (regardless of how the parameter "proportional" is set). If set to "name", then samples are sorted by their name with the <code>mixedsort</code> function. If set to one or more signature names (e.g. "Signature1"), then samples will be sorted from those with the highest level of that signature to the lowest. If multiple signatures are supplied then, samples will be sorted by each signature sequentially. Default "total".
<code>threshold</code>	Exposures less than this threshold will be set to 0. This is most useful when more than one signature is supplied to <code>sort_samples</code> as samples that are set to zero for the first exposure will then be sorted by the levels of the second exposure. Default NULL.
<code>same_scale</code>	If TRUE, then all subplots will have the same scale. Only used when <code>group_by</code> is set. Default FALSE.
<code>add_points</code>	If TRUE, then points for individual sample exposures will be plotted on top of the violin/box plots. Only used when <code>plot_type</code> is set to "violin" or "box". Default TRUE.
<code>point_size</code>	Size of the points to be plotted on top of the violin/box plots. Only used when <code>plot_type</code> is set to "violin" or "box" and <code>add_points</code> is set to TRUE. Default 2.
<code>label_x_axis</code>	If TRUE, x-axis labels will be displayed at the bottom of the plot. Default FALSE.
<code>legend</code>	If TRUE, the legend will be displayed. Default TRUE.
<code>plotly</code>	If TRUE, the the plot will be made interactive using <code>plotly</code> . Default FALSE.

### Value

Generates a ggplot or plotly object

### Examples

```
data(res_annot)
plot_exposures(res_annot, plot_type = "bar", annotation = "Tumor_Subtypes")
```

---

`plot_heatmap`

*Plot heatmaps using the exposures matrix*

---

### Description

The exposures for different signatures can be visualized using a heatmap with this function. Heatmaps make it easier to visualize the data by representing the magnitude of exposure values as color in 2-dimensions. The variation in color intensity can help see if the exposures are clustered or how they vary over space. Exposures can be normalized by providing the proportional argument. Column annotations can also be seen by passing the `col_annot` argument.

## Usage

```
plot_heatmap(  
  res_annot,  
  proportional = FALSE,  
  show_column_names = FALSE,  
  show_row_names = TRUE,  
  scale = TRUE,  
  subset_tumor = NULL,  
  subset_signatures = NULL,  
  annotation = NULL,  
  ...  
)
```

## Arguments

res_annot	A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool.
proportional	If TRUE, then the exposures will be normalized to between 0 and 1 by dividing by the total number of counts for each sample. Default FALSE.
show_column_names	Boolean check. If True, column names are shown. Otherwise, they aren't. Default FALSE
show_row_names	Boolean check. If True, row names are shown. Otherwise, they aren't. Default FALSE
scale	Boolean check. If True, values are scaled by z-score. Otherwise, they aren't. Default TRUE
subset_tumor	Users can specify certain tumor types on which they want to subset the exposure matrix for plotting the heatmap.
subset_signatures	Users can specify certain signatures on which they want to subset the exposure matrix plotting the heatmap.
annotation	Users have the option of plotting the exposure matrix based on their given annotation like Tumor_Subtypes or age. Error given if the user given annotation doesn't exist in the res_annot annotation object.
...	Ellipsis used for passing any arguments directly to the ComplexHeatmap's heatmap function.

## Value

Generates a heatmap for using the exposure matrix.

## Examples

```
data(res_annot)  
plot_heatmap(res_annot = res_annot, proportional = TRUE, scale = TRUE,  
annotation = "Tumor_Subtypes")
```

---

<code>plot_sample_counts</code>	<i>Plot distribution of sample counts</i>
---------------------------------	---

---

## Description

Displays the proportion of counts for each mutation type across one or more samples.

## Usage

```
plot_sample_counts(
  musica,
  sample_names,
  table_name = NULL,
  text_size = 10,
  show_x_labels = TRUE,
  show_y_labels = TRUE,
  same_scale = TRUE,
  annotation = NULL
)
```

## Arguments

<code>musica</code>	A <a href="#">musica</a> object.
<code>sample_names</code>	Names of the samples to plot.
<code>table_name</code>	Name of table used for plotting counts. If <code>NULL</code> , then the first table in the <a href="#">musica</a> object will be used. Default <code>NULL</code> .
<code>text_size</code>	Size of axis text. Default 10.
<code>show_x_labels</code>	If <code>TRUE</code> , the labels for the mutation types on the x-axis will be shown. Default <code>TRUE</code> .
<code>show_y_labels</code>	If <code>TRUE</code> , the y-axis ticks and labels will be shown. Default <code>TRUE</code> .
<code>same_scale</code>	If <code>TRUE</code> , the scale of the y-axis for each sample will be the same. If <code>FALSE</code> , then the scale of the y-axis will be adjusted for each sample. Default <code>TRUE</code> .
<code>annotation</code>	Vector of annotations to be displayed in the top right corner of each sample. Vector length must be equivalent to the number of samples. Default <code>NULL</code> .

## Value

Generates a `ggplot` object

## Examples

```
data(musica_sbs96)
plot_sample_counts(musica_sbs96, sample_names =
  sample_names(musica_sbs96)[1])
```

---

```
plot_sample_reconstruction_error  
    Plot reconstruction error for a sample
```

---

## Description

Displays the observed distribution of counts for each mutation type, the distribution of reconstructed counts for each mutation type using the inferred mutational signatures, and the difference between the two distributions.

## Usage

```
plot_sample_reconstruction_error(result, sample, plotly = FALSE)
```

## Arguments

- |        |  |
|--------|--|
| result | A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool. |
| sample | Name of the sample within the <a href="#">musica_result</a> object.                            |
| plotly | If TRUE, the the plot will be made interactive using <a href="#">plotly</a> . Default FALSE.   |

## Value

Generates a ggplot or plotly object

## Examples

```
data(res)  
plot_sample_reconstruction_error(res, "TCGA-ER-A197-06A-32D-A197-08")
```

---

```
plot_signatures      Plots the mutational signatures
```

---

## Description

After mutational signature discovery has been performed, this function can be used to display the distribution of each mutational signature. The `color_variable` and `color_mapping` parameters can be used to change the default color scheme of the bars.

## Usage

```
plot_signatures(
  result,
  plotly = FALSE,
  color_variable = NULL,
  color_mapping = NULL,
  text_size = 10,
  show_x_labels = TRUE,
  show_y_labels = TRUE,
  same_scale = TRUE,
  y_max = NULL,
  annotation = NULL,
  percent = TRUE
)
```

## Arguments

<code>result</code>	A <code>musica_result</code> object generated by a mutational discovery or prediction tool.
<code>plotly</code>	If TRUE, the the plot will be made interactive using <code>plotly</code> . Default FALSE.
<code>color_variable</code>	Name of the column in the variant annotation data.frame to use for coloring the mutation type bars. The variant annotation data.frame can be found within the count table of the <code>musica</code> object. If NULL, then the default column specified in the count table will be used. Default NULL.
<code>color_mapping</code>	A character vector used to map items in the <code>color_variable</code> to a color. The items in <code>color_mapping</code> correspond to the colors. The names of the items in <code>color_mapping</code> should correspond to the unique items in <code>color_variable</code> . If NULL, then the default <code>color_mapping</code> specified in the count table will be used. Default NULL.
<code>text_size</code>	Size of axis text. Default 10.
<code>show_x_labels</code>	If TRUE, the labels for the mutation types on the x-axis will be shown. Default TRUE.
<code>show_y_labels</code>	If TRUE, the y-axis ticks and labels will be shown. Default TRUE.
<code>same_scale</code>	If TRUE, the scale of the probability for each signature will be the same. If FALSE, then the scale of the y-axis will be adjusted for each signature. Default TRUE.
<code>y_max</code>	Vector of maximum y-axis limits for each signature. One value may also be provided to specify a constant y-axis limit for all signatures. Vector length must be 1 or equivalent to the number of signatures. Default NULL.
<code>annotation</code>	Vector of annotations to be displayed in the top right corner of each signature. Vector length must be equivalent to the number of signatures. Default NULL.
<code>percent</code>	If TRUE, the y-axis will be represented in percent format instead of mutation counts. Default TRUE.

## Value

Generates a ggplot or plotly object

## Examples

```
data(res)
plot_signatures(res)
```

---

plot\_umap

*Plot a UMAP from a musica result*

---

## Description

Plots samples on a UMAP scatterplot. Samples can be colored by the levels of mutational signatures or by a annotation variable.

## Usage

```
plot_umap(
  result,
  color_by = c("signatures", "annotation", "cluster", "none"),
  proportional = TRUE,
  annotation = NULL,
  point_size = 0.7,
  same_scale = TRUE,
  add_annotation_labels = FALSE,
  annotation_label_size = 3,
  annotation_text_box = TRUE,
  plotly = FALSE,
  clust = NULL,
  legend = TRUE,
  strip_axes = FALSE
)
```

## Arguments

result	A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool.
color_by	One of "signatures", "annotation", or "none". If "signatures", then one UMAP scatterplot will be generated for each signature and points will be colored by the level of that signature in each sample. If annotation, a single UMAP will be generated colored by the annotation selected using the parameter annotation. If "none", a single UMAP scatterplot will be generated with no coloring. Default "signature".
proportional	If TRUE, then the exposures will be normalized to between 0 and 1 by dividing by the total number of counts for each sample. Default TRUE.
annotation	Sample annotation used to color the points. One used when color_by = "annotation". Default NULL.
point_size	Scatter plot point size. Default 0.7.

<code>same_scale</code>	If TRUE, then all points will share the same color scale in each signature subplot. If FALSE, then each signature subplot will be colored by a different scale with different maximum values. Only used when <code>color_by = "signature"</code> . Setting to FALSE is most useful when the maximum value of various signatures are vastly different from one another. Default TRUE.
<code>add_annotation_labels</code>	If TRUE, labels for each group in the annotation variable will be displayed. Only used if <code>color_by = "annotation"</code> . This is not recommended if the annotation is a continuous variable. The label is plotted using the centroid of each group within the annotation variable. Default FALSE.
<code>annotation_label_size</code>	Size of annotation labels. Only used if <code>color_by = "annotation"</code> and <code>add_annotation_labels = TRUE</code> . Default 3.
<code>annotation_text_box</code>	Place a white box around the annotation labels to improve readability. Only used if <code>color_by = "annotation"</code> and <code>add_annotation_labels = TRUE</code> . Default TRUE.
<code>plotly</code>	If TRUE, the plot will be made interactive using <code>plotly</code> . Not used if <code>color_by = "signature"</code> and <code>same_scale = FALSE</code> . Default FALSE.
<code>clust</code>	Add cluster labels as annotation
<code>legend</code>	Plot legend
<code>strip_axes</code>	Remove axes labels for cleaner looking plots

## Value

Generates a ggplot or plotly object

## See Also

See [create\\_umap](#) to generate a UMAP in a `musica` result.

## Examples

```
data(res_annot)
create_umap(res_annot, "Tumor_Subtypes")
plot_umap(res_annot, "none")
```

`predict_exposure`      *Prediction of exposures in new samples using pre-existing signatures*

## Description

Exposures for samples will be predicted using an existing set of signatures stored in a `musica_result` object. Algorithms available for prediction include a modified version of "lda", and "decompTumor2Sig".

**Usage**

```
predict_exposure(
  musica,
  table_name,
  signature_res,
  algorithm = c("lda", "decompTumor2Sig"),
  signatures_to_use = seq_len(ncol(signatures(signature_res))),
  verbose = FALSE
)
```

**Arguments**

<code>musica</code>	A <a href="#">musica</a> object.
<code>table_name</code>	Name of table used for posterior prediction. Must match the table type used to generate the prediction signatures
<code>signature_res</code>	Signatures used to predict exposures for the samples <code>musica</code> object. Existing signatures need to stored in a <a href="#">musica_result</a> object.
<code>algorithm</code>	Algorithm to use for prediction of exposures. One of "lda" or "decompTumor2Sig".
<code>signatures_to_use</code>	Which signatures in the <code>signature_res</code> result object to use. Default is to use all signatures.
<code>verbose</code>	If TRUE, progress will be printing. Only used if <code>algorithm = "lda"</code> . Default FALSE.

**Value**

Returns a A [musica\\_result](#) object containing signatures given by the `signature_res` parameter and exposures predicted from these signatures.

**Examples**

```
data(musica)
data(cosmic_v2_sigs)
g <- select_genome("19")
build_standard_table(musica, g, "SBS96", overwrite = TRUE)
result <- predict_exposure(musica = musica, table_name = "SBS96",
                           signature_res = cosmic_v2_sigs, algorithm = "lda")

# Predict using LDA-like algorithm with seed set to 1
set.seed(1)
predict_exposure(musica = musica, table_name = "SBS96",
                           signature_res = cosmic_v2_sigs, algorithm = "lda")
```

**rc***Reverse complement of a string using biostrings***Description**

Reverse complement of a string using biostrings

**Usage**

```
rc(dna)
```

**Arguments**

dna	Input DNA string
-----	------------------

**Value**

Returns the reverse compliment of the input DNA string

**Examples**

```
rc("ATGC")
```

**rep\_range***Replication Timing Data as GRanges Object***Description**

Supplementary data converted from bigWig to bedgraph to GRanges, with low RFD indicating the leading strand and high RFD indicating lagging strand and removing uninformative zero RFD intervals. Timing data is 10kb bins from a colon cancer sample.

**Usage**

```
data(rep_range)
```

**Format**

An object of class "GRanges"; see [annotate\_replication\_strand()].

**Source**

GEO, <<https://www.ncbi.nlm.nih.gov/geo/query/acc.cgi?acc=GSE134225>>

**References**

---

res	<i>res</i>
-----	------------

---

### Description

A musica result created for testing that includes SBS variants with discovered exposures and signatures

### Usage

```
data(res)
```

### Format

An object of class `musica_result` See [discover\_signatures()].

---

res_annot	<i>res_annot</i>
-----------	------------------

---

### Description

A musica result created for testing that includes SBS variants with annotations and discovered exposures and signatures

### Usage

```
data(res_annot)
```

### Format

An object of class `musica_result` See [discover\_signatures()].

---

sample_names	<i>Retrieve sample names from a musica or musica_result object</i>
--------------	--

---

### Description

Sample names were included in the `sample` column in the variant object passed to [create\\_musica](#). This returns a unique list of samples names in the order they are inside the `musica` object.

**Usage**

```
sample_names(object)

## S4 method for signature 'musica'
sample_names(object)

## S4 method for signature 'musica_result'
sample_names(object)
```

**Arguments**

**object** A `musica` object generated by the `create_musica` function or a `musica_result` object generated by a mutational discovery or prediction tool.

**Value**

A character vector of sample names

**Examples**

```
data(res)
sample_names(res)
```

`samp_annot`

*Get or set sample annotations from a musica or musica\_result object*

**Description**

Sample annotations can be used to store information about each sample such as tumor type or treatment status. These are used in downstream plotting functions such as `plot_exposures` or `plot_umap` to group or color samples by a particular annotation.

**Usage**

```
samp_annot(object)

## S4 method for signature 'musica'
samp_annot(object)

## S4 method for signature 'musica_result'
samp_annot(object)

samp_annot(object, name) <- value

## S4 replacement method for signature 'musica,character,vector'
samp_annot(object, name) <- value

## S4 replacement method for signature 'musica_result,character,vector'
samp_annot(object, name) <- value
```

**Arguments**

- |        |   |
|--------|---|
| object | A <a href="#">musica</a> object generated by the <a href="#">create_musica</a> function or a <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool. |
| name   | The name of the new annotation to add.  |
| value  | A vector containing the new sample annotations. Needs to be the same length as the number of samples in the object.   |

**Value**

A new object with the sample annotations added to the table in the `sample_annotations` slot.

**See Also**

See [sample\\_names](#) to get a vector of sample names in the [musica](#) or [musica\\_result](#) object.

**Examples**

```
data(res_annot)
samp_annot(res_annot)

# Add new annotation
samp_annot(res_annot, "New_Annotation") <- rep(c("A", "B"), c(3, 4))
samp_annot(res_annot)
data(musica)
samp_annot(musica, "example") <- rep("ex", 7)
```

---

**select\_genome**

*Helper function to load common human or mouse genomes*

---

**Description**

Helper function to load common human or mouse genomes

**Usage**

```
select_genome(x)
```

**Arguments**

- |   |   |
|---|---|
| x | Select the hg19 or hg38 human genome or the mm9 or mm10 mouse genome in UCSC format |
|---|---|

**Value**

Returns BSgenome of given version

**Examples**

```
g <- select_genome(x = "hg38")
```

**signatures***Retrieve signatures from a musica\_result object***Description**

The signature matrix contains the probability of mutation motif in each sample. Rows correspond to each motif and columns correspond to each signature.

**Usage**

```
signatures(result)

## S4 method for signature 'musica_result'
signatures(result)

signatures(result) <- value

## S4 replacement method for signature 'musica_result,matrix'
signatures(result) <- value
```

**Arguments**

<b>result</b>	A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool.
<b>value</b>	A matrix of motifs counts by samples

**Value**

A matrix of mutational signatures

**Examples**

```
data(res)
signatures(res)
data(res)
signatures(res) <- matrix()
```

**subset\_musica\_by\_annotation**

*Creates a new musica object subsetted to only one value of a sample annotation*

**Description**

Creates a new musica object subsetted to only one value of a sample annotation

**Usage**

```
subset_musica_by_annotation(musica, annot_col, annot_names)
```

**Arguments**

musica	A <a href="#">musica</a> object.
annot_col	Annotation class to use for subsetting
annot_names	Annotational value to subset to

**Value**

Returns a new musica object with sample annotations, count tables, and variants subsetted to only contains samples of the specified annotation type

**Examples**

```
data(musica_sbs96)
annot <- read.table(system.file("extdata", "sample_annotations.txt",
                                package = "musicatk"), sep = "\t", header=TRUE)

samp_annot(musica_sbs96, "Tumor_Subtypes") <- annot$Tumor_Subtypes

musica_sbs96 <- subset_musica_by_annotation(musica_sbs96, "Tumor_Subtypes",
                                             "Lung")
```

**subset\_musica\_by\_counts**

*Creates a new musica subsetted to only samples with enough variants*

**Description**

Creates a new musica subsetted to only samples with enough variants

**Usage**

```
subset_musica_by_counts(musica, table_name, num_counts)
```

**Arguments**

musica	A <a href="#">musica</a> object.
table_name	Name of table used for subsetting
num_counts	Minimum sum count value to drop samples

**Value**

Returns a new musica object with sample annotations, count tables, and variants subsetted to only contains samples with the specified minimum number of counts (column sums) in the specified table

**Examples**

```
data(musica_sbs96)
subset_musica_by_counts(musica_sbs96, "SBS96", 20)
```

**subset\_variants\_by\_samples**

*Return sample from musica\_variant object*

**Description**

Return sample from `musica_variant` object

**Usage**

```
subset_variants_by_samples(musica, sample_name)
```

**Arguments**

<code>musica</code>	A <code>musica</code> object.
<code>sample_name</code>	Sample name to subset by

**Value**

Returns sample data.frame subset to a single sample

**Examples**

```
data(musica)
subset_variants_by_samples(musica, "TCGA-94-7557-01A-11D-2122-08")
```

**subset\_variant\_by\_type**

*Subsets a variant table based on Variant Type*

**Description**

Subsets a variant table based on Variant Type

**Usage**

```
subset_variant_by_type(tab, type)
```

**Arguments**

<code>tab</code>	Input variant table
<code>type</code>	Variant type to return e.g. "SBS", "INS", "DEL", "DBS"

**Value**

Returns the input variant table subsetted to only contain variants of the specified variant type

**Examples**

```
data(musica)
annotate_variant_type(musica)
subset_variant_by_type(variants(musica), "SBS")
```

---

**tables**

*Retrieve the list of count\_tables from a musica or musica\_result object*

---

**Description**

The count\_tables contains standard and/or custom count tables created from variants

**Usage**

```
tables(object)

## S4 method for signature 'musica'
tables(object)

## S4 method for signature 'musica_result'
tables(object)

tables(musica) <- value

## S4 replacement method for signature 'musica,list'
tables(musica) <- value
```

**Arguments**

object	A <code>musica</code> object generated by the <code>create_musica</code> function or a <code>musica_result</code> object generated by a mutational discovery or prediction tool.
musica	A <code>musica</code> object generated by the <code>create_musica</code> function or a <code>musica_result</code> object generated by a mutational discovery or prediction tool.
value	A list of <code>count_table</code> objects representing counts of motifs in samples

**Value**

A list of count\_tables

**Examples**

```
data(res)
tables(res)
data(musica)
tables(musica)
```

**table\_96***Generates a 96 motif table based on input counts for plotting***Description**

Generates a 96 motif table based on input counts for plotting

**Usage**

```
table_96(sample_df)
```

**Arguments**

sample_df	Input counts table
-----------	--------------------

**Value**

Returns a 96 motif summary table

**table\_selected***Retrieve table name used for plotting from a musica\_result object***Description**

The table name

**Usage**

```
table_selected(result)

## S4 method for signature 'musica_result'
table_selected(result)
```

**Arguments**

result	A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool.
--------	--

**Value**

Table name used for plotting

## Examples

```
data(res)
table_selected(res)
```

---

umap

*Retrieve umap list from a musica\_result object*

---

## Description

The signature matrix contains the probability of mutation motif in each sample. Rows correspond to each motif and columns correspond to each signature.

## Usage

```
umap(result)

## S4 method for signature 'musica_result'
umap(result)

umap(result) <- value

## S4 replacement method for signature 'musica_result,matrix'
umap(result) <- value
```

## Arguments

result	A <a href="#">musica_result</a> object generated by a mutational discovery or prediction tool.
value	A list of umap dataframes

## Value

A list of umap dataframes

## Examples

```
data(res)
umap(res)
data(res)
umap(res) <- matrix()
```

**variants***Retrieve variants from a `musica` or `musica_result` object*

## Description

The `variants` data.table contains the variants and variant-level annotations

## Usage

```
variants(object)

## S4 method for signature 'musica'
variants(object)

## S4 method for signature 'musica_result'
variants(object)

variants(musica) <- value

## S4 replacement method for signature 'musica,data.table'
variants(musica) <- value
```

## Arguments

- `object` A `musica` object generated by the `create_musica` function or a `musica_result` object generated by a mutational discovery or prediction tool.
- `musica` A `musica` object generated by the `create_musica` function
- `value` A `data.table` of mutational variants and variant-level annotations

## Value

A data.table of variants

## Examples

```
data(res)
variants(res)
data(musica)
variants(musica)
```

---

%>%

*Pipe operator*

---

### Description

Pipe operator

### Usage

lhs %>% rhs

### Value

NA

### Examples

c(1,2) %>% barplot()
